DETAILED ACTION

Claim Rejections - 35 USC § 102

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

- (b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.
- 2. Claims 1, 3-7, 9, 10, 12, and 14-24, are rejected under 35 U.S.C. 102(b) as being anticipated by Riggle et al. U.S. patent No. 4,968,985.

Regarding to claims 1, Fig. 1 and Fig. 2 Riggle et al. disclose a method for demodulating a signal comprising: receiving a modulated sampled signal (8); buffering a consecutive sequence of the modulated sampled signal (18) and comparing (20) the consecutive sequence with all possible valid modulated sampled signals; and determining a bit decision representing a demodulation of the consecutive sequence of the modulated sampled signal (1), the determination made being based on a valid modulated sampled signal located closest to the consecutive sequence of the modulated sample signal in a constellation (Col. 4 lines 46 – 66)

Regarding to claim 2, comprising receiving a modulated sampled signal GMSK signal (Intended of use 103).

Regarding to claim 3. The method according to claim 1, further comprising quantizing (10,12, 16) the consecutive sequence of the modulated sampled signal before the buffering, thereby forming quantized sequential signals, the quantized consecutive sequence being used in the comparing (Col 4. 26 - 34).

Art Unit: 2819

Regarding to claim 4. The method according to claim 3, comprising concatenating the quantized sequential signals to form a part of an address to a memory, the address and memory being used in the determining (Col. 4 lines 46 - 53).

Regarding to claim 5. The method according to claim 4, comprising storing in the memory bit decisions representing demodulation of all possible consecutive sequences of the modulated sampled signal, the address being used to access the bit decision representing a demodulation of the consecutive sequence of the modulated sampled signal (Fig. 6, Fig. 7).

Regarding to claim 6. The method according to claim 5, comprising using output from a counter (24) as part of the address to the memory.

Regarding to claim 7. The method according to claim 1, comprising buffering consecutive phase locations of the modulated sampled signal (Col. 3 lines 33 – 43)

Regarding to claim 9, wherein the comparing comprises measuring a distance between the consecutive sequence and each valid modulated sampled signals (Col. 6 lines 45-68).

Regarding to claim 10, The method according to claim 9, comprising measuring the distance between the consecutive sequence and each valid modulated sampled signals by measuring the difference between phases of the consecutive sequence and each valid modulated sampled signal (Col.8 lines 53 – 65).

Regarding to claim 12, Fig 1 and 2, Riggle et al. disclosing a method for demodulating a modulated signal comprising: receiving at least one modulated input waveform(8); determining all possible valid modulated waveforms (20); comparing the

Art Unit: 2819

received at least one modulated input waveform with the possible valid modulated waveforms; and determining bit decisions (Fig. 6, and Fig. 7) representing a demodulation of the at least one modulated input waveform, each bit decision representing the valid modulated waveform closest to each received at least one modulated input waveform.

Regarding to claim 14. The method according to claim 12, further comprising quantizing (10,12, 16) the at least one modulated input waveform to form quantized sequential signals.

Regarding to claim 15. The method according to claim 14, further comprising concatenating the

quantized sequential signals to form a part of an address to a memory (Col. 4 lines 46 - 53.)

Regarding to claim 16. The method according to claim 15, comprising storing the bit decisions in

the memory, the address being used to access the bit decisions representing a demodulation of the at least one modulated input waveform (Fig. 6, and Fig. 7)

Regarding to claim 17, Fig. 1 and Fig. 2, Riggle et al as discussed above, disclose a demodulator comprising: a quantizer, the quantizer receiving an input modulated waveform, the quantizer quantizing the input modulated waveform producing quantized data; and at least one memory device operatively connected to the quantizer, the at least one memory device containing bit decisions representing

Art Unit: 2819

demodulation of the input modulated waveform, the quantized data being used to form an address to the at least one memory device.

Regarding to claim 18. The demodulator according to claim 17, further comprising at least one buffer(18), the at least one buffer operatively connected between the quantizer and the at least one memory device (20), the at least one buffer forming the memory address using the quantized data and sending the memory address to the at least one memory device to obtain the bit decisions (1).

Regarding to claim 19. The demodulator according to claim 18, further comprising at least one counter (24) operatively connected to the at least one memory device, an output from the at least one counter being used as part of the memory address to access the bit decisions.

Regarding to claim 20. The demodulator according to claim 17, wherein each at least one buffer is a shift register (18).

Regarding to claim 21. The demodulator according to claim 17, wherein the at least one memory device is a ROM (20).

Regarding to claim 22. The demodulator according to claim 17, wherein the at least one memory device is a RAM (18).

Regarding to claims 23, and 24. The demodulator according to claim 17, wherein the quantizer is an angle or phase quantizer (inherently for PLL 12).

Art Unit: 2819

Claim Rejections - 35 USC § 103

- 3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 4. Claims 2, 8, and 13 rejected under 35 U.S.C. 103(a) as being unpatentable over Riggle et al.

Regarding to claim 2 and 13, Riggle et al. as applied to claims 1 and 12 above disclose every aspect of applicant's claimed invention except for modulated GSMK wave form. How ever is has been held that a recitation is intended to be employed does not differentiate the claimed method from a prior art system satisfying the claimed method limitation. Ex Parte Masham, 2 USPQ2d 1647 (1987).

Regarding to claims 8, Riggle et al. as applied to claims 1 and 7 above disclose every aspect of applicant's claimed invention except for buffering four consecutive phase locations. However on Col. 4 lines 33 – 34, Riggle teach a method of n samples for phase lock loop location. Therefore it would have been obvious to one having ordinary skill in the art at the time the invention was made optimum value the n samples to four, since it has been held that discovering an optimum value of a result effective variable involves only routine skill in the art. In re Boesch, 617 F.2d 272, 205 USPQ 215 (CCPA 1980).

Art Unit: 2819

Allowable Subject Matter

5. Claim 11 is objected to as being dependent upon a rejected base claim, but

would be allowable if rewritten in independent form including all of the limitations of the

base claim and any intervening claims.

6. Claim 25 is allowed.

Contact Information

Any inquiry concerning this communication or earlier communications from the

examiner should be directed to Linh Van Nguyen whose telephone number is (703)

305-1934. The examiner can normally be reached from 8:30 – 5:00 Monday-Friday.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's

supervisor. Mr. Michael Tokar can be reached at (703) 305-3493. The fax phone

numbers for the organization where this application or proceeding is assigned are (703)

308-7722 for regular communications and (703) 308-7722 for After Final

communications. Any inquiry of a general nature or relating to the status of this

application or proceeding should be directed to the receptionist whose telephone

number is (703) 308-0956.
